Wadim **Müller**

Senior Software Engineer · Hardware-Near Systems & Lab Automation

An den Mainwiesen 51, 63533 Mainhausen, Germany

(+49) 176-96526090 | wadim.mueller@mail.de | wafgo | wadim-mueller-b6b44b169

"He who stops being better stops being good." (Oliver Cromwell)

Summary

Senior software engineer with 15+ years of building software that drives real hardware: from Linux kernel drivers and board bring-up up to device integration, data pipelines and operator dashboards. At CMBlu I am the lead developer of the control platform for a fleet of redox-flow battery test stands. I defined its architecture from a blank page, integrate pumps, valves, sensors, power converters and lab cyclers over TCP/IP, Modbus, REST, ZeroMQ and MQTT, and own the path from raw measurement to time-series storage and the operator's screen. Earlier: firmware for oscilloscopes, spectrum analysers and power meters at Rohde & Schwarz and safety-relevant multicore systems at Continental. I enjoy working at the boundary to physicists and hardware engineers, and taking ownership of quality, testability and long-term reliability.

Experience

CMBlu Energy AG

Alzenau, Germany

Embedded Linux Developer · Lead Developer sBMS Control Platform — *since Feb. 2025*

- **Greenfield architecture:** defined and built the control platform (Rust/Tokio) that runs the secondary Battery Management System on every redox-flow test stand: a component framework decoupled through a reactive datastore, configured per platform in YAML, with 50+ component types across ten hardware variants.
- **Device and instrument integration:** BioLogic battery cyclers (REST API, ZeroMQ event stream, WebSockets), TRUMPF AC/DC and DC/DC power converters and ICP DAS I/O modules (Modbus TCP), Mettler Toledo M800 transmitters, flow, pressure and temperature sensors (I^2C, UART, IIO), and an RPMsg bridge to safety firmware on a Cortex-M4 core.
- **Control and safety:** closed-loop PI flow control of pumps and valves, a rule-based safety engine with debounced threshold alarms and a latched software E-STOP, and interlocks that keep deployments and updates from interrupting a running experiment.
- **Operator HMIs and dashboards:** SCADA screens (FUXA) with animated process diagrams, live values and operator controls; fleet dashboards; and `fuxactl`, a tool that turns HMI projects into reviewable code with automated validation against a real runtime.
- **Data pipelines:** telemetry over MQTT/Protobuf into InfluxDB and Azure Event Hub, journal logs into Loki, and a read-only observability service that correlates logs, time series and cycler state across a fleet of 30+ nodes to diagnose anomalies.
- **Engineering practice:** set up the team's quality gates: CI with linting and static analysis, mandatory unit-test coverage per component, tests traceable to requirements, merge-request reviews, and a QEMU-based emulation of the target (incl. a mainline-submitted AM64x SoC model) for testing without hardware.
- Own the Yocto-based Linux distribution for the TI AM64x platform: board bring-up, BSP, kernel drivers (counter, PWM, GPIO, I^2C sensors; one upstreamed to mainline), RPM feed and a guarded over-the-air update path.
- Built an ML soft-sensor estimating the state of charge from operating signals alone (gradient-boosted trees, 2.5M-row corpus, 8% MAE) with a pure-Rust inference engine on the target, and a virtual-screening pipeline (xTB, DFT/Psi4, Spark) with which chemists rank electrolyte candidates before synthesis.

Continental Automotive GmbH

Babenhausen, Germany

Software System Integrator · Embedded Linux Developer — *Jul. 2018 - Jan. 2025*

- Integrated vendor Board Support Packages into instrument-cluster products on Renesas multicore ARMv7/v8 SoCs running Green Hills INTEGRITY.
- Designed and deployed the CMake-based build systems of several instrument-cluster products.
- Debugged system-level failures on multicore ARMv8/v7 systems via JTAG and trace (Green Hills MULTI, Lauterbach Trace32, ARM ETM), and built in-house tooling for it (offline stack unwinding, ETM setup).
- Built QEMU machine emulation of customised Renesas R-Car3 boards so that software could be developed and tested before hardware was available (github.com/wafgo/qemu).
- Deployed a Yocto-based Linux distribution as flash front end for INTEGRITY-based instrument clusters.
- Designed the architecture for regulating outbound DNS traffic in multi-account, multi-VPC AWS environments (Route53 DNS Firewall, FMS).

Magna Powertrain

Sailauf, Germany

Embedded Software Engineer — *Jan. 2017 - Jul. 2018*

- Implemented brushless DC motor-control algorithms on resource-limited microcontrollers and ported FreeRTOS to the NXP S12Z.
- Designed an MCU-agnostic software architecture for drive-control algorithms, with a kbuild-style build system on GNU make.

Rohde & Schwarz

Mainhausen, Germany

Embedded Software Engineer — *Jan. 2009 - Dec. 2016*

- **Instrument firmware:** developed embedded firmware for test and measurement instruments: oscilloscopes, spectrum analysers, power meters, LCR meters and multimeters, from board bring-up to measurement application modules with unit tests.
- Implemented the USB TMC device interface used across several instrument families for remote configuration, control and measurement-data retrieval.
- Wrote Linux kernel drivers and bring-up software for custom i.MX6 and Renesas SH2A boards, incl. an SPI-to-Ethernet bridge (PIC32 firmware plus Linux network driver).
- Built a Lauterbach Trace32 script infrastructure for early-boot debugging.

Skills

Programming	C, C++, Rust, Python, Bash, Perl
Device Interfaces	TCP/IP, REST, WebSockets, MQTT, Protobuf, ZeroMQ, Modbus TCP, USB TMC, RPMsg, I^2C, SPI
Data & Monitoring	InfluxDB, Grafana, Loki, Prometheus, Azure Event Hub, PySpark/Databricks
HMI & Vision	SCADA HMIs (FUXA), web dashboards, OpenCV, V4L2, stereo-camera calibration
Systems & Low-Level	Linux kernel drivers, Yocto, U-Boot, FreeRTOS, QEMU/KVM, Docker
Quality & Debugging	GitLab CI, automated testing, code review, GDB, Trace32, JTAG/ETM
Languages	German, English, Russian

Open Source

Linux Kernel (mainline)

lore.kernel.org

Maintainer and Contributor — *since 2022*

- Author and maintainer of the upstream IIO driver for the Sensirion SLF3S liquid-flow sensor (v7.3), incl. devicetree binding, IIO core additions and KUnit tests.
- Initial mainline bring-up of the NXP S32G3 SoC; RISC-V support for `checkstack.pl`; a generic GPIO-based counter driver and a PCI-endpoint block-device passthrough (covered on LWN), both under review.

QEMU

lore.kernel.org/qemu-devel

Contributor — *since 2026*

- TI AM64x SoC model and machine that runs the stock TI boot chain end to end (ROM, R5 SPL, TF-A/OP-TEE, U-Boot, SMP Linux); fix and qtest for an SDHCI ADMA bug.
- Further: pyelftools (RH850 relocations), GEF (RISC-V), Psi4 (GauXC backend proposal), radare2, pahole.

Education

Technische Hochschule Aschaffenburg (University of Applied Sciences)

Aschaffenburg, Germany

B.Eng. in Electrical Engineering and Information Technology — *Sep. 2008 - Aug. 2012*

- Emphasis on Microelectronics with final grade of 1.5 (First Class Honours).
- Thesis: Development of an USB Device Interface based on the Test and Measurement USB Class Standard (USB TMC).

Hochschule Darmstadt (University of Applied Sciences)

Darmstadt, Germany

M.Sc. in Electrical Engineering — *Sep. 2014 - Aug. 2017*

- Extra-occupational study with emphasis on Microelectronics with final grade of 1.1 (First Class Honours).
- Thesis: FPGA-accelerated Linux system for real-time depth mapping from a calibrated stereo camera (V4L2, OpenCV) on a Zynq SoC: image-processing IP cores in C++/HLS, UIO kernel driver and the processing application. https://github.com/wafgo/morphological-filter-ip-core, https://github.com/wafgo/disparity-coprocessor-ip-core, https://github.com/wafgo/linux-kernel-custom-hw-uio, https://github.com/wafgo/rt-depth-map.
